

Chapter 5: The "Bones" (Intro to HTML)

I. Your Coding "Toolbox"

- **Text Editor:** Writing code is best done in a specialized _____ editor (like _____) because it offers features like color-coding and mistake checking.
- **Validation:** Use the _____ website to check your code for errors, like a "spell-checker" for HTML.
- **Device Testing:** Websites must be tested on different devices (phones, tablets) to ensure _____ works, meaning the layout looks great on any screen size.

Deep Dive Discussion

1. **Text Editor Choice:** Besides color-coding, what specific feature of a specialized code editor is most important when you are trying to find a mistake in a long file, and why?

Application Activity

1. **Responsive Check:** Find a website you use frequently. Using your browser's developer tools (or just resizing the window on a desktop), describe one specific way the site's layout changes when viewed on a phone (e.g., the menu collapses into a single icon).

II. What is an HTML File? (The Boilerplate)

Every HTML file must contain the core _____ structure:

- **DOCTYPE:** The _____ declaration, which is written as _____ for HTML5.
- **<head>:** The _____ of the page; contains _____ (data the user doesn't see).
- **<body>:** Contains _____ the user **does** see (text, images, links).

Essential <meta> Tags

Tag	Purpose	Why it's Critical
<meta charset="UTF-8">	Character Encoding	Supports almost all _____ and symbols.
<meta name="viewport"...>	_____	Tells mobile devices to use

		their actual screen width.
<meta name="description"...>	Page Summary	Provides a short summary of your page for _____ results.

Deep Dive Discussion

1. **Head vs. Body:** If you accidentally put your main <h1> headline inside the <head> section instead of the <body>, what would happen when the browser loads the page?

III. Tags, Elements, and Attributes

- **Element:** The entire unit: _____ tag + content + _____ tag.
- **Empty Element:** A tag that does not have a closing tag (e.g., _____ or _____).
- **Nesting Rule:** The _____ tag you open is the _____ one you must close.
- **Attribute:** Special information added to the _____ tag to give the element extra instructions (e.g., id or class).

Application Activity

1. **Nesting Fix:** The following code is broken because the tags are not nested correctly. Fix the code to properly show strong emphasis inside the paragraph:
- **Broken Code:** <p>This is my strong paragraph.</p>
 - **Fixed Code:**

IV. Semantic Layout (The "Big 5")

- **Semantic HTML:** Using tags that clearly describe their _____ and the type of content they contain. (Good for SEO and _____).
- **Grouping Elements:** Tags like <p> that automatically start their content on a _____ line.

Semantic Tag	Purpose (What content goes inside?)
<header>	The introductory content of a page or section (often contains _____)

	and the site title).
<code><nav></code>	Marks a block of _____ links.
<code><main></code>	Contains the _____, unique, and dominant content of a page (only _____ per page).
<code><article></code>	A _____ piece of content, like a blog post or news story.
<code><footer></code>	The closing content of a page or section (often contains _____ or contact info).

Deep Dive Discussion

1. **Semantic vs. Generic:** If we used a generic `<div>` tag for our site's navigation instead of a `<nav>` tag, the visual result would be the same. Why is using `<nav>` still the professional, preferred way to code?

V. Content, Lists, and Links

Text and Emphasis

- **Text-Level Elements:** These are _____ elements that do **not** start a new line.
- **Importance:** Use `<strong>` to indicate content of strong importance and `<em>` to indicate content that is _____.

Lists

- **Ordered List:** Use the _____ tag for items that follow a sequential, defined order (e.g., instructions).
- **Unordered List:** Use the _____ tag for lists where the items have no sequential order (e.g., bullet points).
- **Description List:** Use the _____ tag, which uses a term (`<dt>`) and a description (`<dd>`).

Images and Links

- **Image Tag:** The `<img>` tag requires two main attributes: _____ (where to find the image) and _____ (the description for accessibility).
- **Link Tag:** The `<a>` tag creates a hyperlink and requires the _____ attribute to

specify the destination URL.

- **New Tab:** To force a link to open in a new browser tab, use the attribute _____.
- **Special Characters:** Use a _____ (like © or) to display symbols not on the keyboard.

Application Activity

1. **Hyperlink Construction:** Write the complete HTML code for an image that links to a contact page, following these rules:

- **Image File:** images/phone-icon.png
- **Image Description:** A small drawing of a telephone.
- **Link Destination:** contact.html
- **HTML Code:**
